

Dear Dr. Graham,

I have told you of a number of miraculous results from using the Mark V LasrPulsr on my patients, but I have sometimes failed to relate my many personal experiences with the laser. The most recent was last Friday while examining my wife and taking her pulse and blood pressure, I decided to check my own. I had been a little tired lately, assuming it was from a recent virus. I had used the Mark V for the cold symptoms and they went away almost immediately. However a day later I lost my voice temporarily without any sore throat and felt a little more fatigued than usual the following week. When I took my own pulse I was surprised to have difficulty counting it because of the extremely irregular beat. There was no predictable pattern of skipping, but I was missing so many beats that my pulse was 43 bpm. This is often indicative of atrial fibrillation, which my father had for 40 to 50 years before dying at age 93. I decided I had better treat it, so I immediately used the muscle protocol over my thyroid and heart. Upon completion I checked my heart numerous times. It now varies from between 50 and 75 beats before missing a beat. My pulse is now usually 76 bpm. I am sure that it will continue to improve, but I am very happy to have a heart that I can live with.

Richard S. Ray, D.C.
