

Part 9 – Does the American Medical Association (AMA) understand Natural Energy Medicine?

Do you know what your doctors believe?

Do you know how this may affect your health care?

Do you know the goals of your health care provider?

Paradigm:

A set of assumptions, concepts, values, and practices that constitutes **a way of viewing reality** for the community that shares them, especially in an intellectual discipline.

One that serves as a pattern or model.

(This article is not about individual physicians. This article is about the basic belief system that different health care organizations are based on. It is up to you to find out if your personal health care provider shares your understanding of health care.)

Paradigms, we all have lots of them and each one is unique to the individual or organization that has them. A paradigm is much more than just an opinion or what you may believe at some given time. It goes to the basic core belief system that you have for any given subject. Your paradigm or view of any given reality begins with everything you have ever heard or been taught and everything you have experienced or thought about any given subject since the day you were born. This makes your individual paradigms very unique to only you. However, groups of individuals will come together such as health care organizations, and create a paradigm based on the major views that they collectively share. Because of the personal nature of a paradigm they are very difficult to change and paradigms of organizations are almost impossible to change. As stated above, it is your responsibility to find out what the paradigms or belief systems of your individual doctors are. This article will make an attempt to define the two basic paradigms that different health care organizations have and how those patterns or models may affect the way those organizations approach health care.

Health care organizations were founded on one of two basic paradigms, belief systems.

In health care there are two major views or two major paradigms of thought. These different views are not based on what these organizations believe about health care as much as they are based on their paradigm of where their patients came from. The core belief of one paradigm says we were created, the core belief of the other paradigm says we were not. So in what way does this affect our health care? In almost every way. One believes that we should return the causes of health to our patients and the other believes that we need to remove the causes of disease from our patients. This actually changes your ultimate goals of health care. This article will try to explain this concept in a clear and logical manor. I know that this can be a very sensitive subject for many readers so I am not trying to put a right or wrong side to this subject, just state that there are two sides and how this should effect you. Unfortunately I am sure that this article will appear that I am bias to the side of creation. This will undoubtedly occur because creation is my paradigm of thought making it almost impossible to remove form my writing. So I will apologize for this up front and ask you to remember that I am trying to present the facts of both sides in a logical manor.

Where does your doctor think you came from and how does that effect their method of health care?

Health Care Professions that have Creation at the center of their paradigm such as the field of Natural Energy Medicine.

Health care professions that are based on creation believe that the body was designed, engineered and created. And if it was created then it is only logical to believe that it was created for a reason and with a specific purpose in mind. And if man was created then he was not the only thing created because we were not designed to live in the vacuum of space without food. We need the proper fuel to live and an environment that allows us to survive. Therefore they must believe that our planet was also created for us and specifically engineered to provide the fuel and environment that is ideal for us to not only survive but to thrive.

Personally, I believe that the entire creation process both of man and this planet occurred exactly the way it is described in Genesis 1 of the Bible.

Health Care Professions that do not have Creation at the center of their paradigm such as Western Medicine.

Health care professions that are not based on creation are totally different than what we just described. Without a creator then there was no designing or engineering or purpose, meaning that there are no norms or original design specifications, we just are. We developed on this planet because the environment happen to fit the needs of man or the needs of man developed to fit this planet. Either way, we came from this planet technically making it our "mother". Therefore we need to address and treat this planet as such. Using our intellect it is our responsibility to do what is necessary to insure the health and survival of our species and the planet we live on.

Where we believe we came from also determines what we believe the body is.

So what do you believe your body is? We all have one so we should all have an opinion. I believe we were created as described in the Bible which means we are made up of two major components.

One is our physical body which is just a very sophisticated machine which is Tangible & Temporary.

The second is the person that lives in that machine which is Intangible & Eternal.

Even though both parts are very significantly intertwined there are still two parts.

In health care we are primarily dealing with the tangible machine and how the function of that machine effects the person living inside. But we also have to be concerned about how that person that lives inside effects the machine.

I cannot really say what the health care professions believe that do not believe in creation as there are probably as many different opinions as there are organizations and individuals.

So what does this actually have to do with the practice of health care?

Regardless of where you think the human body came from, as health care providers we are primarily dealing with a tangible machine called the human body which makes doctors a lot like mechanics, similar to any mechanic that works on any machine. So let's pretend that you own a Ford automobile dealership and you need to hire an automobile mechanic.

Two mechanics show up to be interviewed for the job.

#1 mechanic believes that Ford vehicles were designed, engineered & created at Ford.

#2 mechanic believes that Ford vehicles were not engineered, designed, or created by Ford but just came into being.

Who would you hire and what is the difference between them?

#1 mechanic utilizes the motor manuals written by Ford to return the vehicles to factory specs thereby returning them to the best function possible. Everything from the fuel the vehicle was designed to burn to the position and timing of every moving part. When he aligns your vehicle he opens the manual written by Ford and says this is the position the engineer that designed this vehicle said was correct. All other ways regardless of how close they are to correct are still wrong. In health care we would call this returning the cause of health.

#2 mechanic does not utilize any manuals because he does not believe they exist, after all, with no designer, engineer or creator, who would have written them. And with no manuals there are no norms because they were not engineered, designed or built to any specifications or plans or even for a specific purpose. They just are. Therefore when he attempts to align your vehicle he has to determine what is closest to correct. To help him make this determination he may take the measurements of a thousand cars the same age and make that appear to function somewhat normal and take the bell curve average of them and call that normal. In health care we would call this keeping you within the population average. Unfortunately the average population is not normal or healthy.

Over all the years of my practice I have never understood why so many people pick mechanic #1 one for their car and mechanic #2 for themselves? Isn't the mechanic that is good enough for you also good enough for your car?

Is this important to you and shouldn't it affect the way we think as Health Care providers? And more importantly, shouldn't it affect the way we select our health care providers?

I realize that there is a time and need for both methods, but for the most part we at LazrPulsr System follow the paradigm of Natural Energy Medicine and set our goals to return the causes of health.

However, when you assume that there are causes of health, you must also believe that there is a NORMAL for the body, or original engineering specifications. Since Orthodox Medical Health Care has its roots based on a philosophy other than creation, it eliminates that organization from even considering this option. They cannot return the causes of health because technically they do not believe there are any. It is not within their paradigm of understanding. This limits them to just trying to remove all the different causes of disease and this helps me to understand why they approach health care the way they do. Remember that I am not talking about individual doctors of any profession. I am just talking about how Western Orthodox Medicine views the body and how they approach health care.

So why is the Western Orthodox Medical paradigm so profoundly accepted as the only way of looking at health care in this country? Because it is not just limited to the doctor patient relationship. It is a major influence within our government, our social and news media, and extends into almost all aspects of our life. When it is the only thing you have ever heard it becomes the only thing you know, your **paradigm** of health care.

Every day you hear of a new debate over what products are good for you and what is not, such as:

Butter or Margarine?

Natural acquired immunity or immunizations?

Synthetic verses whole food nutrients?

Nutrition verses prescription drugs?

Cane sugar verses artificial sweetener?

And the lists go on and on as they continue to test and debate everything.

Why is everything up for debate? Because based on the paradigm of health care in the US there is no right or wrong, no normal or abnormal everything is in shades of gray and must be double blind tested, evaluated and debated. This is why butter is good one day and bad the next and continues to change on a daily basis according to the latest research study. Add to this that research testing is very expensive and you seldom see the results of these tests not be bias toward the organization that is funding the research. This is also why the normal findings of lab tests change as the health of the population changes.

However, for the health care professions that have creation at the center of their paradigm, there is little to debate. Why? Because creation dictates that there is a right and wrong, a normal and abnormal. You simply have to ask one question, **which one did God, our creator make, verses which one did man adulterate?** Then you have your answer. This rational is logical and is very difficult to debate. How can a creation (man) create something better for himself than his creator (God) made for him? Or, who knows more about how a human being works, humans themselves or the one that designed, engineered and created humans?

I will tell you that we at LazrPulsr System believe in Creation and this belief dictates how we look at health care and is at the root of our therapy system. We believe that man was designed, engineered and created, that we were given exact programing and information that controls every aspect of how we function. And that our body was engineered to function within precise mechanical specifications. Our therapy goals are to return the body as best we can to its original normal programing and information thereby returning not only the normal physiology and function of organs and systems but also the mechanical function of the body as well. We then make recommendations on how to feed yourself properly with the food that was engineered and created for us to eat.

So as you can see the way you look at health, the way you approach health care, the health care you try to provide and even the ultimate goals of your health care are dictated on where you believe man came from. So to answer the original question, does the AMA understand natural energy medicine? The answer is not very well because as a profession, it is not within their paradigm of understanding. And the same can be said about natural energy medicine having a poor understanding of orthodox medicine. Not to say that individual doctors of either profession may practice either method, and patients may go to both forms of health care professionals for care. But what they really understand is still dependent on their personal paradigm of where you, their patient, came from.

So regardless of which way you believe we came into being, that belief should affect the type of health care you want and trust. It should also guide you in making all of your personal health care decisions.

Dr. Gerry Graham III

President: LazrPulsr System
