

Incorporating Natural Energy Medicine into your Practice. West Nile

(Part 10)

West Nile is not as common as Lyme and more seasonal as it is usually contracted from mosquito bites. And even though they state that about 10,000 people die each year from West Nile in the US the number of non-lethal cases is far greater than they publish. The reason for this is they seldom ever check for West Nile unless the case develops into a chronic serious condition. And West Nile even though it is one of the worst virus infections is not that difficult for the body to eventually manage on its own in most cases. However that does not mean that the body always completely recovers from West Nile. Many times the disease is just managed but not corrected and the West Nile virus stays as a subclinical benign infection that the body keeps under control until it becomes compromised. Then the virus can return to an active infection again.

This occurs often with West Nile as West Nile is one of the more difficult viruses to correct. The reason for this I am told is that West Nile is one of the genetically engineered viruses. Being genetically engineered it is not a normal natural virus that the body can easily defend itself from as it does under normal circumstances with natural occurring viruses. And as stated in “Part 6 Lyme” of this series West Nile is a very common infection that may show up a few weeks following the Lyme protocol.

When treating all infectious diseases there is one thing that we must keep reminding our users of. None of the infections disease protocols that we list will kill any of the pathogens related to the diseases. The LazrPulsr therapy system does not kill anything and has no capacity to do so under any circumstances. What the LazrPulsr therapy system does is help correct and improve the programming and function of the immune system to find, identify, and destroy the pathogen. This is similar to the old saying that you can give a man a fish and feed him for a day or teach him to fish and feed him for life. When you show the body’s immune system how to defend itself from viruses and it has the necessary nutrients it does an amazing job at not only correcting itself but then keeping itself healthy.

You will be able to find many cases of West Nile in your current patients. They will probably not know they are infected and many will not even be currently symptomatic. However if you have a chronically ill patient or a patient that has a difficult time with recovering from colds or flu check for West Nile.

The easiest way to check for West Nile is to have the patient hold the remedy on the West Nile therapy card and check for any physiological response such as a change in muscle tone, change in leg length or arm length, change in ROM etc. If the body reacts to the remedy you will know it is ready for this therapy procedure.

Do you treat West Nile in your office?

If not, why?

Tens of thousands of patients are chronically ill from West Nile and many people die every day from it. The West Nile protocols are very effective, easy to run and the patient usually has a full recovery.
