

Incorporating Natural Energy Medicine into your Practice. Staphylococcus & Streptococcus

(Part 8)

Staphylococcus: The most obvious and common place to contract a Staphylococcus infection is in a hospital. And it can also be another secondary subclinical infection following Lyme. Staph infections can be very serious and many people die from this every day in the US.

Do you currently treat this in your office? If not, then why? You have many current patients that need this therapy and if you don't, who will?

Streptococcus: Streptococcus infections are also common and are even more contagious than the Staphylococcus bacteria. This can also be another secondary subclinical infection following Lyme.

Do you currently treat this in your office? Don't count on orthodox medicine to completely manage these infections. Families can continue to spread Strep throat from one person to another for months even while they are on antibiotics. These infections are not difficult to resolve with Natural Energy Medicine and minimal nutritional support.

Again, these are patients that few providers want if for no other reason they don't want the exposure of strep in their office.

If you don't treat Strep throat or any strep infections in your office you are missing a large section of service that your patients need in a very serious way.

This may be a good time to mention this. Don't be afraid of the common infectious diseases. Take your nutrition, and treat yourself even before you come down with any of the infections to prevent them from effecting you. I am around patients with Staph, Strep, Lyme, Plague, West Nile, Colds, Flu, and probably a lot of other things on a daily basis. They don't scare me because I follow one simple rule. "Doctor heal thyself." I do to myself what I recommend for my patients to do. If I didn't believe it would work on me enough to treat myself then how could I convince my patients to do it? Keep your health where it should be and stop worrying about some little microbe that has no chance of effecting the wellbeing of a healthy person. And when patients say, "I should not come in because I don't want to expose you or your staff to what I have," that is the perfect time to say your germs won't bother us because we have already been treated. And we know it will work on you because it already worked on us.
