

## **Incorporating Natural Energy Medicine into your Practice. First Aid (Recovery Care)**

(Part 12)

Those of us that are alternate health care providers many times feel that first aid should be left to the medical profession with their emergency rooms. Remember that first aid procedures rendered in emergency rooms are usually restricted to just first aid and lifesaving procedures which has little to do with health care. The patient is then referred to their primary care provider for follow up care which they usually do. Why shouldn't this be you? Energy medicine is by far the most sophisticated and advanced healing therapy ever developed. All research demonstrates that injuries of all kinds that are just treated with Low Level Laser will heal over two times as fast. Then add the additional pulsed frequency therapy and homeopathy that makes up Natural Energy Medicine that can target the exact tissue that was injured and it enhances the healing significantly greater. Then add the correct nutrition and all of the other things that we already do to promote healing and no other provider of any profession can even come close to doing what you can. Not only that but it is the safest form of therapy ever developed so there is no risk of making the injury worse. The safety issue alone is more than most providers can say.

If you have a patient that is scheduled for surgery do you then schedule them for follow up recovery care? If you have a patient that suffers from a broken bone, after the emergency care has set the fracture and stabilized the injury do you schedule them for recovery from that fracture? And probably the worst kind of injury is burns. Nothing is more painful or has more risk of complications and slower healing than a burn. Natural Energy Medicine can stabilize burns, remove the pain from burns, prevent the complications from burns, promote the speed of healing and prevent scarring better than any other therapy known to man.

Remember that emergency rooms usually only focus on the primary injury. If you have a fracture they focus on the bone injury but we know that the bone is only one of many tissues that can be injured in a trauma that caused a fracture. Who else would address all of the injuries sustained in traumatic injuries? Everything from bug bites, burns, fractures, strains and sprains, cuts and bruising, and even head injuries should be scheduled for recovery care in your office. This is care that very few if anyone offers in your community not even the medical profession. If no one offers this care then where is your competition? The only thing you have to do is let people know that you do offer it and that it is vital for proper recovery.

There may be a question of cost or if they will heal anyway why spend the money on recovery care. It is quite simple to explain that if you can heal two to three times as fast, significantly reduce the amount of medications and pain killers, reduce the risk of complications, reduce the need for supportive care from your family which does get old after a day or two for them, and return to work much faster, the cost of the care pays for itself many times over.

Just the time loss from work is reason enough to pay for recovery care. Did you know how the medical profession talked the government into mandatory immunizations? It was not for the so called improved health benefits for our children, it was because they calculated the number of days that parents would have to miss work to stay home with sick children and said if you reduced that by a specific percent that the program would pay for itself many times over. Of course by the time they figured out that it did not save any lost days of work due to sick children and in many cases increased the days of work lost, immunizations became a standard of care that was not going to change.

So when you are promoting injury recovery in your office don't be afraid to build it around the financial savings for your patients as it is the best incentive.

Do you promote or even offer first aid recovery care in your office?

If not, why? These are really great patients that are a pleasure to treat. They are usually generally healthy besides the acute injury that you are treating. They respond very quickly, there is little work for the doctor because all of the healing protocols are already outlined. The primary care provider does not even have to do the therapy as the patient can usually treat themselves when managed by a staff member.

First aid and first aid recovery is a very important component of health care and a very needed component of care that is missing from most communities that can be incorporated into any practice immediately with little to no investment.
